

Barbershop Canyon

Hypericum scouleri, *Scutellaria galericulata*, *Erigeron saxitilis*, *Polemonium foliosissimum*

Barbershop Canyon is a deeply incised drainage cut into the Coconino Sandstone of the Mogollon Rim, draining to the north via East Clear Creek into the Little Colorado River. Vegetation on the ridges above ranges from Ponderosa Pine forest to mixed conifer at the upper elevations. These ridges and the upper draws host a large number of perennial springs, which contribute to the incredible diversity of plant species found in the area.

Management & Location

The site is under Coconino National Forest management, and falls between Dick Hart Ridge and Dane Ridge, north of the Mogollon Rim Road #300. It encompasses Barbershop Canyon and its tributaries (including Dane Canyon), up to the point where the canyon meets East Clear Creek. A number of USFS dirt roads access the ridges between the tributaries and many of the springs in the upper draws. A few hiking trails drop into the canyons, but most hiking is rugged cross country or boulder hopping up the canyon bottoms. Elevations range from 6500' at the confluence of Barbershop & Clear Creek, up to 7800' along the Rim Road.

2010 Goals & Parameters

Barbershop Canyon was the location of the first PAPAZ training trip in the summer of 2008. The specimens collected then were added to vouchers that Glenn Rink had been collecting in the area earlier that year. Subsequently, Glenn and several other botanists returned to continue the effort and cover portions of the area not visited previously. The vouchered list produced by this effort contains close

to 450 taxa. No group trips are planned for this year, but some individual follow-up will continue to happen.
